

MAT KO PCR

Introduction

The primers contain homologous sequences upstream (F) and downstream (R) of MAT and bind to the Universal F1 or Universal R1 region flanking His3 on OLP45. The PCR product is used to delete MAT locus with His3.

Materials

- > TaKaRa LA Taq® DNA Polymerase (Mg2+ free buffer) RR002A
- > 10 µM OLPr008 MAT -33 UKO F
- > 10 µM OLPr012 MAT +34 SEY UKO R
- > Template: [OLP045](#)

Procedure

PCR

1. Chose the number of 50 µL reactions (include one additional reaction for no-template control):

Settings	
	# of reactions
1	0.5

2. Combine the following reagents to prepare the master mix (contains 0.5 additional reaction to account for pipetting discrepancies):

Master mix		
	A	B
1		1 X [µL]
2	ddH2O	28.5
3	10X LA PCR Buffer	5
4	25 mM MgCl2	5
5	dNTP Mix (2.5 mM each)	8
6	10 µM OLPr008 MAT -33 UKO F	1
7	10 µM OLPr012 MAT +34 SEY UKO R	1
8	LA Taq Polymerase (5 U/µL)	0.5
9	OLP045 (pFA6a-His3MX6) (5 ng/µL)	1
10	Total	50

3. PCR program "MATKO" in folder "STEPHAN":

94°C/2 min—[94°C/0.5 min—61°C/0.5 min—68°C/1.5 min]x30—68°C/5 min—10°C/∞

Gel

4. Gel: sample volume see below/0.5 µg O'GeneRuler DNA Ladder Mix/1% TAE/120 V/35 min

Load 0.1, 0.2, 0.4 and 0.8 µL of the PCR product (i.e. by diluting PCR product 1:10 by mixing 2 µL product with 18 µL H₂O, then load 1, 2, 4, and 8 µL of the diluted product).
Load 10 µL of no-template control.
Expected product size: 1447 bp
